```

CRIM Per capita crime rate by town.

ZN Proportion of residential land zoned for lots over 25,000 sq.ft.

INDUS Proportion of non-retail business acres per town.

CHAS Charles River dummy variable

NOX Nitric oxides concentration

RM Average number of rooms per dwelling

AGE Proportion of owner-occupied units built prior to 1940

DIS Weighted distances to five Boston employment centers

RAD Index of accessibility to radial highways

TAX Full-value property-tax rate per $10,000

PTRATIO Pupil-teacher ratio by town

LSTAT Percentage of the lower status of the population

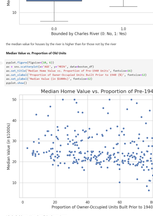
MEDV Median value of owner-occupied homes in $1000s

TASK 2

Median Value of Houses vs. Charles River

```
[8]: # Set the aesthetic style of the plots
     sns.set_style("whitegrid")

     # Create the boxplot
     pyplot.figure(figsize=(8, 5))
     ax = sns.boxplot(data=boston_df, x="CHAS", y="MEDV", palette="Set2")
     ax.set_title('Median Value of Houses vs. Charles River', fontsize=14)
     ax.set_xlabel('Bounded by Charles River (0: No, 1: Yes)', fontsize=12)
     ax.set_ylabel('Median Value (in $1000s)', fontsize=12)
     pyplot.show()
```



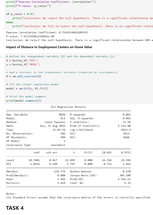
the median value for houses by the river is higher than for those not by the river

Median Value vs. Proportion of Old Units

```
[9]: pyplot.figure(figsize=(10, 6))
     ax = sns.scatterplot(data=boston_df, x="AGE", y="MEDV", palette="Set2")
     ax.set_title('Median Home Value vs. Proportion of Pre-1940 Units', fontsize=16)
     ax.set_xlabel('Proportion of Owner-Occupied Units Built Prior to 1940 (%)', fontsize=12)
     ax.set_ylabel('Median Value (in $1000s)', fontsize=12)
     pyplot.show()
```

Nitric Oxide vs. Non-Retail Business Acres

```
[10]: pyplot.figure(figsize=(10, 6))
      ax = sns.scatterplot(data=boston_df, x="INDUS", y="NOX", palette="Set2")
      ax.set_title('Nitric Oxide Concentration vs. Non-Retail Business Acres', fontsize=16)
      ax.set_xlabel('Proportion of Non-Retail Business Acres per Town', fontsize=12)
      ax.set_ylabel('Nitric Oxides Concentration (parts per 10 million)', fontsize=12)
      pyplot.show()
```



Median Value vs. Distance to Employment Centers

```
[11]: pyplot.figure(figsize=(10, 6))
      ax = sns.scatterplot(data=boston_df, x="DIS", y="MEDV", palette="Set2")
      ax.set_title('Median Home Value vs. Distance to Employment Centers', fontsize=16)
      ax.set_xlabel('Weighted Distances to five Boston Employment Centers', fontsize=12)
      ax.set_ylabel('Median Value (in $1000s)', fontsize=12)
      pyplot.show()
```

TASK 3

Difference in Median Value by Charles River Proximity

```
[12]: # Calculate the median values for each group
      group0 = boston_df[boston_df['CHAS'] == 0]['MEDV']
      group1 = boston_df[boston_df['CHAS'] == 1]['MEDV']

      # Perform the independent t-test
      t_statistic, p_value = stats.ttest_ind(group0, group1)

      print("T-statistic: {t_statistic:f}")
      print("P-value: {p_value:f}")

      if p_value < 0.05:
          print("Conclusion: We reject the null hypothesis. There is a significant difference in median values.")
      else:
          print("Conclusion: We fail to reject the null hypothesis. There is no significant difference in median values.")
```

```
T-statistic: 3.996437e+00
P-value: 7.390623e-05
Conclusion: We reject the null hypothesis. There is a significant difference in median values.
```

Difference in Median Values by Age of House

```
[13]: # Create age categories
      boston_df['age_group'] = pd.cut(boston_df['AGE'],
                                      bins=[0, 35, 70, 100],
                                      labels=['35 years and younger', '35 to 70 years', 'Over 70 years'])

      # Calculate median values for each age group
      anova_groups = [group['MEDV'].values for name, group in boston_df.groupby('age_group')]

      # Perform one-way ANOVA test
      f_statistic, p_value = stats.f_oneway(*anova_groups)

      print("F-statistic: {f_statistic:f}")
      print("P-value: {p_value:f}")

      if p_value < 0.05:
          print("Conclusion: We reject the null hypothesis. There is a significant difference in median values across age groups.")
      else:
          print("Conclusion: We fail to reject the null hypothesis. There is no significant difference in median values across age groups.")
```

```
F-statistic: 3.745811e+00
P-value: 2.454930e-02
Conclusion: We reject the null hypothesis. There is a significant difference in median values across age groups.
```

Relationship between Nitric Oxide and Non-Retail Acres

```
[14]: correlation_nox_indus = boston_df['NOX'].corr(boston_df['INDUS'])

      print("Pearson Correlation Coefficient: {correlation:f}")
      print("P-value: {p_value:f}")

      if p_value < 0.05:
          print("Conclusion: We reject the null hypothesis. There is a significant relationship between NOX and INDUS.")
      else:
          print("Conclusion: We fail to reject the null hypothesis. There is no significant relationship between NOX and INDUS.")
```

```
Pearson Correlation Coefficient: 0.763651660783953
P-value: 2.454930e-02
Conclusion: We reject the null hypothesis. There is a significant relationship between NOX and INDUS.
```

Impact of Distance to Employment Centers on Home Value

```
[15]: # Define the independent variable (DIS) and the dependent variable (LSTAT)
      X = boston_df['DIS']
      y = boston_df['LSTAT']

      # Add a constant to the independent variable (required by statsmodels)
      X = sm.add_constant(X)

      # Fit the linear regression model
      model = sm.OLS(y, X).fit()

      # Print the summary of the model
      print(model.summary())
```
